TITLE: The registration efficiency of a neutron scintillation detector

SOURCE: Voprosy* dozimetrii i zashchity* ot izlucheniya, no. 2, 1963, 146-151

TOPIC TAGS: scintillation detector, neutron detector, neutron absorption, Monte Carlo method, scintillation, carbon, Taylor series, hydrogen

ABSTRACT: Accurate data on detector characteristics, such as the shape of the spectral line and the registration efficiency of scintillation detectors with organic crystals is not as yet available. Only a number of approximate formulas for the calculation of registration efficiency of counters is available. These formulas take into consideration: 1) the single stage scattering in hydrogen, 2) the single stage scattering in hydrogen and carbon, and 3) the single stage scattering in carbon and the single and double stage scattering in hydrogen. The authors [Neutron Dosimetry (Proceedings of a Symposium on neutron detection, dosimetry and standardization, Harwell, 10-14 December, 1962), v. 1, 597, International Atomic Energy Agency, Vienna, 1963] have developed a semi-analytic Monte Carlo method for calculating the amplitude distribution of pulses and the counter

Card 1/2

ACCESSION NR: AT4021264

effectiveness of a detector with an organic scintillator. This method proves to be highly effective and acquires high calculation precision with moderate machine time consumption. All interaction processes of neutrons with nuclei of the scintillation substance are taken into consideration, including the marginal effects on the walls of the scintillator. These are presented in a graph. The paper also includes a table of registration efficiency for a 30 X 30 mm crystal. Orig. art. has: 3 formulas, 3 figures, and 1 table.

TITLE: Spatial and energy distribution of scattering Gamma radiation from a unidirectional source in an infinite air medium

SOURCE: Atomnaya energiya, v. 18, no. 3, 1965, 251-252

TOPIC TAGS: reactor Gamma radiation, spatial distribution, energy distribution, Gamma ray scattering

ABSTRACT: The field of the scattered gamma radiation was investigated both by the Monte-Carlo method and experimentally. The adaptation of the Monte-Carlo calculation to the present problem was discussed by the authors elsewhere (Voprosy fiziki zashchity reaktorov [Problems of Reactor Shielding], Gosatomizdat, 1963, p. 171). The energy distributions were calculated for orientation angles of the unidirectional source ranging from 2-180° (10 values). Distributions are also calculated for the following: (1) source-detector distance of 16 meters and initial energies 0.4, 12.5, 3.0, and 7.0 MeV, (2) average energy 1.25 MeV at distances 5, 16, and 30 meters, (3) distance of 16 m and an average energy 1.25 MeV (from a Co60 source) at angles 60, 90, 120, and 150°. The values of the distribution function

SOURCE: Atomnaya energiya, v. 19, no. 1, 1965, 51-56

TOPIC TAGS: fast neutron, neutron spectrum, mathematic matrix, single crystal, crystal counter, spectrometer, Monte Carlo method

ABSTRACT: Matrices are calculated for the treatment of results of measurements of fast-neutron spectra. The counting efficiencies of a stilbene crystal (height 30 mm and diameter 30 mm) in the energy range 1 to 18 Mev taking into account energy resolution were calculated on the basis of the line shapes $K(E \supset p, E)$, found by the Monte-Carlo method for 55 values of the initial neutron energy. Calculations were performed for 4 values of the resolution parameter (standard deviation). The direct and inverse transposed matrices are presented. Orig. art. has 3 formulas, 3 graphs, and 3 tables.

TITLE: Analysis of the systematic error due to differentiation of apparatus spectra measured by fast neutron single crystal scintillation spectrometer

SOURCE: Atomnaya energiya, v. 19, no. 1, 1965, 56-59

TOPIC TAGS: fast neutron, neutron spectrum, neutron spectroscopy, single crystal, scintillation spectrometer, particle scatter, Monte Carlo method, approximation, differentiation

ABSTRACT: The error introduced in the line shape of neutron spectra obtained in a neutron-proton recoil scintillation spectrometer due to the use of the differentiation method in the single scattering approximation is considered. Monte-Carlo calculations using this approximation were performed. A histogram of the line shape of a detector with a cylindrical stilbene crystal is given for incident neutron energies of 1.0 and 4.15 Mev, and the deviation of the derived differential spectra from the ideal values is shown as a function of neutron energy from 1 to 5 Mev for 1.05- and 2.05-Mev protons, for three different sizes of cylindrical stilbene crystal. It is found that for slowly changing spectra the errors associated with line-shape distortion are within a few percent, but for quickly changing neutron spectra, the error of the differentiation method can reach significant values. Orig. art. has: 4 figures, 4 formulas. [NA]

TITLE: Analysis and generalization of the correlation method of measuring the
particle lifetime distribution in a physical system

SOURCE: Obninsk. Fiziko-energeticheskiy institut. Doklady, no. 21, 1965, Analiz
i obobshcheniye korrelyatsionnogo metoda izmereniya raspredeleniya vremeni zhizni
chastits v fizicheskoy sisteme, 1-12

ABSTRACT: The authors present a complete statistical analysis of the correlation
method of measuring the distribution of the lifetime of particles in a linear
physical system. The method is reduced to a determination of the mutual correla-
tion function between a pseudorandom signal used to modulate the intensity of the
measured particles coming from the source, and the counting rate of the detectors.
It is shown that the statistical accuracy of the method depends both on the off-
duty factor of the modulating random signal and on the presence of a noise back-

Card 1/2

L 27477-66

ACC NR: AT6008420

0

ground against which the measurements are made. In particular, it is shown that the conclusions made by T. E. Stern et al. (J. of Nucl. An., p.A/B, 16, 499, 1962) that the use of random (or pseudorandom) excitation can completely reduce the measurement time compared with the classical method (ordinary periodic excitation) is valid only when there is an appreciable background. When there is no background, on the average the statistical accuracy of the classical and correlation methods is approximately the same. A new method of pseudorandom modulation of the particle source is proposed, to take advantage of this fact. If the modulation is made coherent with the background noise, then it can be readily shown that the fast component of the background can be readily eliminated in the same manner as in the classical method, and the slow component can be eliminated by suitable choice of the off-duty factor of the modulating signal. This type of statistical modulation prevents loss of the peak value of the modulated intensity and thus permits the use of the peak power of the source and retain the favorable advantages of the correlation method. TITLE: Automatic control of the thermal state of a blast furnace

SOURCE: Stal', no. 7, 1965, 585-589

TOPIC TAGS: automatic control, blast furnace, algorithm, digital computer

ABSTRACT: The currently used methods for controlling the thermal state of a blast furnace have considerable deficiencies. There is considerable delay in receipt of data for control changes. Control should be performed directly on the change in thermal and reductive work of the gases, depending on their distribution in the charge and their movement through it. Theoretical principles for thermal control by composition of flue gas have been developed: a) minimum usage of coke for smelting cast iron of a given composition under given conditions of charge material and melting is defined, b) these parameters of the process are directly maintained at a level necessary to produce iron with minimum deviation from the given composition when all heat reserves of the process are used.

Card 1/2

L 22139-66

ACC NR: AP6012947

On the basis of these considerations, an algorithm for control of the thermal state of a furnace was developed by the Lisichan Scientific Research Institute for Computers for use in the "Sovetchik Master" (SM-2) computer at blast furnace A of the plant imeni Dzerzhinskiy. This device is a digital computer which performs the mathematical and logical processing of input information on the basis of this algorithm. 7

During an 18-day trial period in May and a 36-day trial period in October-November, 1963, the computer recommended 108 changes in coke quantity and 144 changes in blast temperature. The results were positive; the thermal state of the furnace was mainly disrupted only when the recommendations were not fulfilled and during changes in loading without recommendation by the computer.

The recommendation control considerably increased consistency in output composition. Coke usage was decreased by 2.5%. The algorithm can be used only when the furnace is under regular use. Engineer S. Z. Nemchenko, Engineer A. S. Skorobogatov, Engineer M. I. Obuvalin, Engineer T. I. Slamchinskaya, Engineer A. M. Yunchik, Engineer Yu. M. Samarets, and Engineer D. S. Kalashnikov participated in the work. Orig. art. has: 3 figures and 2 tables. /JPRS/

TITLE: Photocopying equipment for contact printing of copies. Class 57, No. 173607

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 15, 1965, 146

TOPIC TAGS: photographic equipment, photographic printer

ABSTRACT: This Author Certificate presents photocopying equipment for contact printing of copies from various negatives onto one common backing for bulk preparation of superimposed negatives or printed circuits. To increase the productivity and to improve the production quality, a negative mounting unit, a manipulator, a preliminary mounting unit, a unit for precise superposition of negative and backing contour, and an illumination unit for exposure are mounted in a single case (see Fig. 1 on the Enclosure). The negative mounting unit is in the form of several revolving coordinate tables whose position is fixed in the range of the superposition unit and in the exposure zone. The manipulator is mounted on a horizontal plate which moves on prismatic guides into the zone of preliminary

3

backing mounting and is provided with a coordinate-rotary table movable in any direction. This table is connected by a ball support to a magnetic table intended for fastening an auxiliary table-satellite. All of the units of the photoequipment are connected to one common control unit. To increase the accuracy of superimposing negative and backing contour by two points removed from each other with a minimum expenditure of time, the precise superposition unit is provided with a two channel optical system. Two different portions of the superimposed surface are visible in the field of view of the ocular. Orig. art. has: 1 diagram.

TITLE: Existence of the Silicide W₃Si 1

PERIODICAL: Fizika metallov i metallovedeniye, 1959, Vol 8, Nr 6,
pp 878-880 (USSR)

ABSTRACT: The authors point out that the question of the existence of W₃Si has not been settled (Ref 2,3) in spite of the considerable volume of published X-ray data on the silicides of high-melting VI group metals. The conversion of higher into lower molybdenum or tungsten silicides which occurs when the surface-silicided metals are heated to about 1700°C is accomplished with the participation of a chemical reaction governed by redistribution of s- and d-electrons in the metals. The authors give this reaction in terms of the number of molecules in the unit cell and using published (Ref 1) X-ray data, calculate the volume percentage of the phases (Table 1). From considerations of isomorphism the authors calculated the W₃Si lattice parameter $a = 4.910 \pm 0.01 \text{ \AA}$ and prepared specimens in which this phase could be observed metallographically and by X-ray diffraction. Tungsten (99% W) cylinders 20 mm in diameter were saturated to a depth of about

Existence of the Silicide W_3Si

100 microns, with silicon (99% Si) in a neutral atmosphere to give two phases: WSi_2 and W_5Si_3 (Fig 1). On heating to $1700^\circ C$ in air W_3Si was found at the W/W_5Si_3 boundary (Fig 2), from which a diffraction pattern (Fig 3) was obtained. This phase had a texture due to that of the tungsten. The authors compare (Table 2) the experimental and calculated crystallographic values for W_3Si . The lattice parameter was found to be $a = 4.910 \pm 0.005 \text{ \AA}$, the X-ray density $d = 16.2 \text{ g/cm}^3$. There are 3 figures, 2 tables and 3 references, 2 of which are Soviet and 1 English.

SOURCE: Fizika metallov i metallovedeniye, v. 16, no. 6, 1963, 931-933

TOPIC TAGS: tungsten disilicide, oxidation, thermocouple, PtRh PtkRh thermocouple, oxidation curve

ABSTRACT: Oxidation of tungsten disilicide has been investigated. The process was conducted in air at a temperature range of 650-1500C. Samples 20 x 10 x 0.1 mm were produced in a vacuum of 5×10^{-5} mm Hg by filling tungsten plates with powdered silicon. Nichrome elements were used to produce temperatures up to 1000C, and silicon carbide elements were used for higher temperatures. The temperatures were measured with a PtRh-PtkRh thermocouple and were kept constant. In the course of oxidation the samples were weighed with an accuracy of ± 0.01 mg. Below 1000C the experiments were conducted uninterruptedly; above 1000C they were interrupted due to the formation of dense film on the surface of the plates. As can be seen from Fig. 1 of the Enclosure the rate of oxidation curves changed shape at various

Card 1/2

ACCESSION NO: AP4009390

temperatures. Up to 1000C the weight increase followed the formula $W = kt^m$, where W is the weight change per unit area (in mg/cm^2), and t is the time of oxidation (in minutes). At 1150-1250C the curves assume a descending trend because at these temperatures WO_3 becomes extremely volatile. A dense, glassy coating of SiO_2 forms at 1300C, and the process of oxidation progresses logarithmically. The formation of such a coating is described by R. Kiffer and F. Benesovsky (Symposium on Powder Metallurgy, Iron. a. Steel Inst. prep. gr., IV, 1953, 40). The logarithmic progress follows the expression $W = k_1 \ln(k_2 t + k_3)$, where k_1 , k_2 , and k_3 are determined by the method described by A. Champion and T. White (J. Inst. Metals, 1949, 75, 375). Metallographic and x-ray investigation disclosed the presence of W_5Si_3 under the glassy coating on WSi_2 oxidized for a long time at high temperatures. Orig. art. has: 2 graphs, 3 formulas, and 2 tables.

TITLE: Oxidation of lower tungsten and molybdenum silicides

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 11, 1965, 1911-1916

TOPIC TAGS: tungsten compound, molybdenum compound, silicide, oxidation kinetics, silica, *PHASE COMPOSITION, METAL OXIDATION*

ABSTRACT: The oxidation of W_5Si_3 and Mo_5Si_3 , obtained by the vacuum silicidizing of tungsten and molybdenum, was carried out in air in the 500-1000°C temperature range. The structure and phase composition of the oxides were determined by metallographic and x-ray methods. The two silicides displayed a similar behavior during oxidation: in both cases, oxides are formed by the metal and silicon. Because the metal oxide is adjacent to the silicide--whereas SiO_2 is found on the surface--it is postulated that atmospheric oxygen penetrates to the surface where it forms SiO_2 . Differences in the oxidation kinetics of the two silicides are due to the difference in the vapor pressure of WO_3 and MoO_3 . It is noted that the lower W and Mo silicides are much

ABSTRACT: Specimens of tungsten disilicide prepared from 99.9%-pure tungsten and silicon powders, either by hot compacting at 1700C, by cold compacting and sintering in an argon atmosphere at 1000C for 1 hr, or by siliconizing of tungsten in a vacuum of 10^{-5} mm Hg at 1250C had a porosity of 3, 40, or 0%, respectively. All specimens were tested for oxidation behavior in air at 600—1100C. Hot compacted, and cold compacted and sintered specimens gradually disintegrated into yellow powder at 700—1000C. On specimens obtained by vacuum-siliconizing, an oxide layer was formed which prevented the disintegration of the specimens. These results showed that the oxidation failure of homogeneous WSi_2 was not a specific property of the material but was caused by macrodefects (pores). In all cases, disintegration occurred in the temperature range where the oxidation products are not volatile. The oxidation behavior of poreless WSi_2 indicated that disintegration of poreless WSi_2 specimens is as-

W₆Si₃ phase formation. The W₆Si₃ phase was prepared by fusion between tungsten and silicon chips. The tungsten chips were cut from WSi₂ powder at 1500°C. The metal was completely converted to a single phase as evidenced by photomicrographs utilizing 20 microns specimens. Tungsten chips of sizes 1 mm x 1 mm x 1 mm and 1 mm in diameter were used. In each case a thin layer of SiO₂ was formed. All experiments were carried out in a vacuum furnace. X-ray analysis showed the presence of a W₆Si₃ phase. Analysis for the x-ray pattern

Card 1/2

L 65095-65

of this phase is tabulated. It might be assumed that the necessary conditions for formation of the lower oxide were created during elimination of the metal in #5013 powder. However, only a small amount of metal was removed from the face of tungsten specimens after annealing at 1500°C for 30 hours. A comparison of x-ray patterns from the specimen and from the original metal shows a nonlinear relationship between the intensity of the peaks in the oxide layer and the intensity of the peaks in the original metal. This indicates that the oxide layer is not uniform in thickness. The situation in the Mg-Si system, where the oxide layer is uniform in thickness, is different from the situation in the tungsten system. The oxide layer in the tungsten system is not uniform in thickness, and the intensity of the peaks in the oxide layer is not proportional to the intensity of the peaks in the original metal.

Title : Physicochemical Investigation of Binary Systems Water-Sodium Sulfate and Water-Magnesium Sulfate.

Orig Pub : Zh. neorgan. khimii, 1956, 1, No 1, 100-124

Abstract : Investigated were the viscosity η , specific conductance κ and density d of binary systems $H_2O-Na_2SO_4$ at 25 and 33° and $H_2O-MgSO_4$ at 25°. The results are compared with literature data. Experimentally determined isotherms of all the studied properties are devoid of specific points and can be considered either as portions of non-singular curves or as portions of branches of singular curves. By using the investigated systems as example it is shown that equations of Jones and Dol [transliterated] for η (relative) and also the equation of Onsager-Kohlrausch,

for κ are applicable to binary systems only in the region of low concentrations. Equations of Lattey [transliterated] and shidlovskiy are applicable only in the case of unsaturated solutions and do not fit the experimental data on κ of oversaturated solutions. The equation of property isotherm proposed by M.A. Reshetnikov (Izv. Sektora fiz.-khim. analiza IONKh AN SSSR, 1949, 19, 166) approximates to a sufficient degree the definition of variations of κ , fluidity (φ) and d of aqueous solutions of electrolytes over the entire range of concentration. Noted is the certain deviation of values of φ , calculated in accordance with the equation of Reshetnikov, from the experimental data relating to φ of oversaturated solutions of Na_2SO_4 . The causes of these deviations were not determined. It is shown that by means of the isotherm equation it is possible to evaluate, with a sufficient degree of

TITLE: A Method of Combined Hot and Cold Forming of Gears by Means of Special Rollers (Kombinirovannaya goryache-kholodnaya nakatka shesteren)

PERIODICAL: Byul. tekhn.-ekonom. inform. sov. nar. kh-va Khar'kovskogo ekonom. adm. r-na, 1958, Nr 1, pp 31-36

ABSTRACT: After numerous experiments, special rolling stands were designed for hot and cold forming of gears (G) (with an accuracy consistent with Technical Specifications), having a module (reciprocal of pitch diameter) of 5. A general view of a stand for hot forming of Gs is given, and the kinematics of its operation are described. G blanks are heated by means of HF currents supplied by a 500-kw generator, through a transformer with a winding ratio of 1:18, to an induction heater of the sectorial-faceplate type. The technology of the process consists of the following steps: 1) Machining of the blank on a metal lathe; 2) hot forming of the G by special rollers; 3) pickling; 4) broaching of the hole; 5) turning down the G to specified outer

Card 1/2

SOV/137-59-1-1567

A Method of Combined Hot and Cold Forming of Gears (cont.)

diameter; and 6) cold working of the G. The process of hot forming of a G requires 50 seconds and that of machining of the hole 15 seconds; operations of gear milling and shaving to standard specifications consume 420 seconds. Compared with milling of G's, the employment of the method of hot-and-cold forming of G's increases the productivity by a factor of 5; the cost of labor constitutes 20 kopecks per G, instead of one ruble, and the over-all saving achieved on each article amounts to ~6 rubles. After completion of the first five of the above steps on G's with a module of 5, fifteen milling and shaving machines at the plant are freed for some other operations. G's obtained by this method are characterized by greater strength and wear resistance.

<p>accumulation and transformation of substances in cultivated and wild cherries. O. M. Efremko. <i>Russk. Khim. Khim. Rostovsk</i> 7, 233-7(1940). There is a constant increase of the sugar content (nearly double) and of sol. substances and a decrease of acidity (by 1/2) in the ripening of cherries. The monosaccharides increase during storage as a result of splitting of sucrose, and of the polysaccharides. After 10 days the total sugar content increased by 3.34%. The actual acidity decreases during storing. The cherry tree twigs contain considerable amts. of starch and a relatively low percentage of sugar during the autumn months. During December, January and February sugar content increases with a simultaneous decrease of starch. Water-sol. N decreases considerably to the moment of the beginning of the active spring growth. The dependence of the chemical composition of cultivated and wild cherries on the geographical factor. <i>Ibid.</i> 237-8. The Southern varieties of cherries are sweeter than are the Northern varieties. The Muscat cherries from the Nikitin Botanical Gardens contain sugars 11.75 and acids 0.82% and a sugar:acid ratio 14.3. The resp. values of the Leningrad varieties are 10.82%, 1.24% and 8.8%. The Lotovaya variety from the Samarkand Pomological Gardens and from Leningrad contain, resp., sugar 9.81 and 8.61, acids 1.44 and 2.14% and the ratio sugar:acid is 6.8 and 4. The differences in the chemical compositions of different varieties of cultivated and wild cherries. <i>Ibid.</i> 238-42. Analyses are given. W. R. Henn</p>

TITLE: Intensifying Breakdown Operations in Rolling Heavy Sheet (Intensifikatsiya rezhimov obzhatiya pri prokatke tolstykh listov)

PERIODICAL: Sb. nauchn. tr. Zhdanovsk. metallurg. in-t, 1957, Nr 4,
pp 126-142

ABSTRACT: Experimental rolling (R) and study of existing breakdown schedules (B) for thick sheets of the major sizes, types, and grades of steel on the Nr-1 mill of the im. Il'ich plant make it possible to define the unused power and available energy of the mill during the initial period of R of 8.8x2095 mm and 10.8x2085 mm Nr-3 steel sheets, and also to determine unused biting capacity of the rolls. These factors are used to develop and recommend new, more intensive B schedules, envisaging a considerable increase in B during the first passes, with the present deformation ratios being retained essentially at the end of B. The B of sheets of different types and dimensions was performed in 21-23 passes as against 27-31 passes under the

Card 1/2

SOV/137-58-8-16826

Intensifying Breakdown Operations in Rolling Heavy Sheet

old B schedules, making it possible to reduce the R time for a single ingot and thus to raise the productivity of a three-high Lauth mill by 5-6% on the average.

TITLE: Certain Special Features of Change in Shape During Rolling in Angle Passes (Nekotoryye osobennosti formoizmeneniya pri prokatke v uglovykh kalibrakh)

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Chernaya metallurgiya, 1958, Nr 3, pp 102-110

ABSTRACT: A coordinate grid is used to study changes in shape occurring in a 300-mm laboratory mill in the angle-pass rolling of Pb samples made of stamped and straightened square billets tinplated with technical Sn on all side faces and fused in a special jig to produce the coordinate grid. To roll a Nr-4 angle, square specimens of 34x34 mm cross section, made of 16 pieces, are used, while when a non-equilateral angle is to be rolled rectangular samples of 29x40 mm, made up of 15 pieces, are employed. It is established that when the sample is fed diagonally into the first angular pass, deformation spreads from the bottom groove, and the metal layers at the inside bases of the flanges show an increase in width. If the nonequilateral

Card 1/2

Zhdanov Metallurgical Inst.

Certain Special Features of Change in Shape During Rolling in Angle Passes (cont.) SOV/137-58-12-24445

leader and finishing grooves are on rolls with equal vertical projections, a further shift in the profile elements of the apex occurs, leading to a rise in roll wear. The spread of the sample in the first pass with diagonal feed is small and involves a deformation similar to upsetting. In this system of grooving, samples in which $B/H=1.41$ were held well in the rolls, in the R of nonequilateral angles, while when $B/H=1.7-1.75$, they were twisted around.

TITLE: Improved Reduction Conditions on a Reversing Thick-Sheet Mill at
Insufficient Power of the Main Motor

PERIODICAL: "Sb.nauchn.tr.Zhdanovsk. metallurg. in-t", 1960, No.5, pp.257-263

TEXT: The authors analyze factors determining the permissible reduction
in the rolling of sheets and plates on a reversing 1,200x4,450 mill. It is estab-
lished that the factor, limiting the reduction, is insufficient power of the drive
motor. Under these conditions it is recommended to perform the metal grip by the
rolls not at the time of speeding-up the motor, which requires the expenditure of
the dynamical torque component, but after the rolls have attained the rated rota-
tion speed; to accelerate the speed of rolls the time of pauses should be used..

Poltava Province - Wheat

New high-yield varieties of winter wheat for Poltava Province. Dost. sel'khoz.
No. 2, 1953.

Monthly List of Russian Accessions, Library of Congress, June 1953. Uncl.

COUNTRY : USSR
 CATEGORY : Cultivated Plants. Grains. Leguminous Grains.
 Tropical Cereals.
 RES. JOUR.: Ref Zhur-Biologiya, No. 5, 1959, No. 20 211

Author : Kuz'menko, M.V.; Yefimenko, T.M.
 INST. : Kharkov University
 TITLE : Results of Winter Wheat Selection in
 Veselopedlyansk Selection Station.

ORIG. PUB.: V. sb.: Vopr. metodiki selektsii pshonitsy
 i kukuruzy, Khar'kov, Un-t, 1957, 29-39

ABSTRACT : During the last few years the varieties
 Veselopodolyanskaya 499 and Veselopodolyanskaya
 10 were bred which are resistant to leaf rust,
 to lodging and drought; in winter resistance
 they approach Lenostepka 75. In a comparative
 test on 11 plots in the years 1951-1955,
 Veselopodolyanskaya 449 yielded 29.7 to 45.3
 cwt/ha, surpassing Lenostepka by 5-10.8 cwt/ha.
 In 1955 on 6 variety plots it produced after
 black fallow 39.5-55 cwt/ha, on a cover and

Zadachi i uprazhneniya po matematicheskomu analizu dlya vtuzov (Problems
and Exercises in Mathematical Analysis for Vtuzes) Moscow, Fizmatgiz,
1959. 472 p. 40,000 copies printed.

Ed. (Title page): Boris Pavlovich Demidovich; Tech. Ed.: K. F. Brudno;
Ed. (Inside book): N. A. Ugarova.

PURPOSE: This book is approved by the USSR Ministry of Higher Education as
a textbook for students of vtuzes, especially correspondence students and
evening students specializing in mechanical engineering. It may also be
used for independent study.

Problems and Exercises in Mathematical (Cont.)

SOV/2061

COVERAGE: The book is a collection of 3193 problems on higher mathematics (excluding analytic geometry) arranged in systematic order for vtuzes. At the beginning of each chapter a short theoretical introduction, necessary formulas, and solutions of more important typical problems are given. Answers are given for all problems, and for the more complicated ones hints and drawings are provided, making the book more useful to correspondence students. The authors give special attention to the more important parts of the subject, such as, calculation of limits, differentiation and integration technique, construction of graphs, application of differential and integral calculus, series, and solution of differential equations. Chapters covering these subjects, therefore contain more problems than the others. The authors thank Docent S. N. Kuz'min, Docent Ye.A. Lubny-Gertsyk, instructors N. V. Sakharov, G. V. Tolstova, and L. Z. Yudelevich, Professor A. P. Yushkevich, Docent I. N. Bronshteyn, Ye. A. Soboleva, the Moskovskiy energeticheskiy institut (Moscow Institute of Energetics) Vsesoyuznyy zaochnyy inzhenerno-stroitel'nyy insitut (All-Union Civil Engineering Correspondence Institute), Docent R. S. Guter, and N. A. Ugarova, editor of Fizmatgiz, for help in preparing the book. There are no references.
